The Interaction Between Media and Society in Promoting Sports Culture Among Young Generations

Imad Eddine Heded[1]*

[1] University of El Oued (Algeria), heded-imadeddine@univ-eloued.dz

Abstract:

The relationship between media and society plays a fundamental role in shaping sports culture among young generations. This article examines how digital and social media platforms interact with broader societal forces to promote sports participation and engagement among youth. Drawing on recent academic sources from 2020 onward, the article analyzes how media serves as an agent of socialization, influencing young people's sports identity, attitudes, and participation behaviors. Key findings reveal that social media, streaming services, and digital content significantly enhance sports engagement among youth while also raising concerns about access and commercialization. Future research directions are proposed.

Keywords: social media, sports culture, youth, media socialization, sports engagement.

***Corresponding author** heded-imadeddine@univ-eloued.dz*

1. INTRODUCTION

Over the past two decades, the landscape of both media and sports has been transformed by the rapid rise of digital technologies. Young people today grow up in an environment saturated with media messages about sports from highlight reels on Instagram and TikTok to live-streamed events on YouTube and athlete content on various digital platforms. This media-rich context does not merely reflect sports culture; it actively constructs and promotes it (Tian et al., 2023).

Understanding the relationship between media and society in the context of sports is a central concern in communication studies. Media, broadly understood to include social media platforms, television, digital streaming services, podcasts, and online news, functions as a channel through which cultural values, practices, and identities are transmitted across generations (Wang & Cheng, 2023). In the specific domain of sports, media plays a dual role: it entertains audiences and simultaneously encourages them to adopt sports as part of their lifestyle and identity (García-Fernández et al., 2023).

Young people broadly defined here as individuals between the ages of 13 and 25 represent a particularly important demographic in the study of media and sports culture. They are among the most active consumers of digital media, and their sports behaviors, preferences, and identities are significantly shaped by the content they consume online (Abeza et al., 2022). The growth of social media has given young people not just passive exposure to sports content, but interactive tools through which they can engage with athletes, discuss matches, join fan communities, and even create their own sports-related content (Dunn et al., 2022).

Despite a growing body of research on media and sports, there remains a need to synthesize current findings around the specific question of how media and society interact to promote sports culture among young generations. This article addresses that gap by gathering and analyzing recent academic evidence across several related topics: how media platforms influence sports participation, how sports content is consumed by youth on digital platforms, how media promotes social identity through sports, and what theoretical frameworks best explain these relationships.

The central questions guiding this article are: How do different media platforms contribute to promoting sports culture among young people? What is the relationship between media consumption and youth sports participation? How does media intersect with societal factors such as identity formation, peer influence, and community building in the promotion of sports? What are the implications of these interactions for communication professionals, sports organizations, and policymakers?

By addressing these questions, the article contributes to the fields of media studies, sports communication, and youth development, offering insights that are relevant for both academics and practitioners working in these areas.

2. Methodology

This article adopts a systematic information-gathering approach to synthesize current knowledge on the interaction between media and society in promoting sports culture among young generations. The research process involved identifying, evaluating, and integrating findings from peer-reviewed academic sources published between 2020 and 2024.

Sources were identified through searches of major academic databases including PubMed Central (PMC), SAGE Journals, Springer Nature, ScienceDirect, Human Kinetics Journals, and the Humanities and Social Sciences Communications platform. Key search terms included combinations of the following: "social media and sports," "youth sports participation," "media and sports culture," "sports identity and media," "digital media and sports," "e-sports and youth," and "media socialization sports."

Inclusion criteria required that sources: (a) were published in 2020 or later in peer-reviewed journals or as verified academic publications, (b) directly addressed the relationship between media and sports culture or sports participation, particularly among young people, and (c) were accessible through open-access channels or academic archives. Sources that did not engage specifically with youth audiences, or that addressed media and sports in ways unrelated to the promotion of sports culture, were excluded.

After screening, ten primary sources were selected for detailed analysis. These sources represent a mix of meta-analyses, systematic reviews, quantitative

studies, and qualitative investigations, offering a range of methodological perspectives on the topic. Data from these sources were analyzed by identifying key themes, theoretical frameworks, and empirical findings relevant to the research questions. The synthesis was organized around three major themes: (1) media as a driver of sports participation, (2) digital platforms and sports content consumption among youth, and (3) media, identity formation, and community building in sports culture.

Visuals presented in this article were developed by the author based on the data and findings gathered from these sources. They are designed to illustrate key patterns, relationships, and comparisons identified during the analysis process.

3. Information Collection and Analysis

3.1 Media as a Driver of Sports Participation

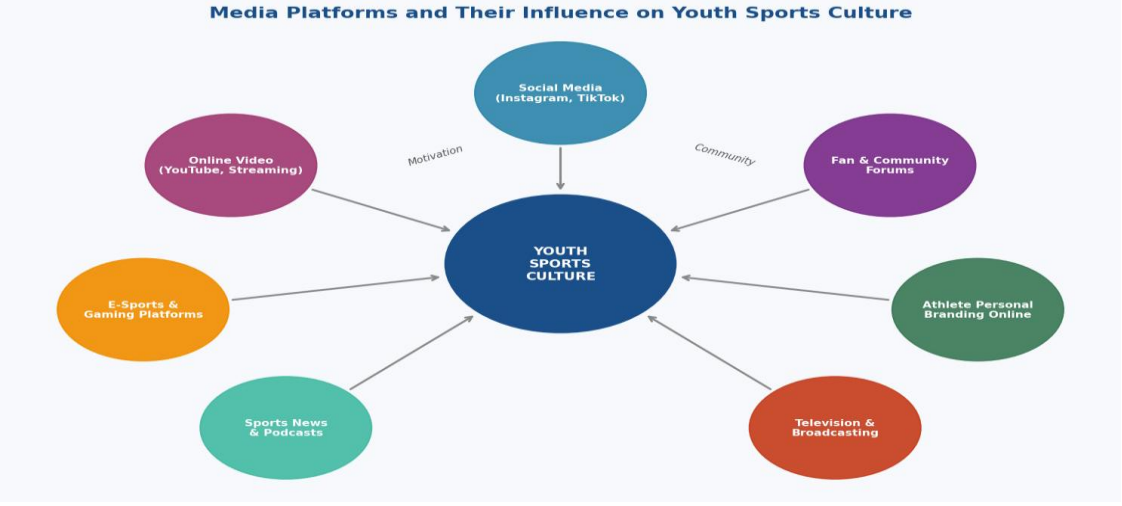
A central finding in the literature is that media use has a measurable effect on young people's engagement with sports though the nature of this effect is complex and sometimes nuanced. A comprehensive meta-analysis published in Digital Health (Tian et al., 2023) examined the relationship between media use and sports participation behavior across numerous studies. The findings revealed that the type of media consumed matters significantly. Traditional passive media use such as watching television for general entertainment was associated with reduced physical activity, as it competes with time that might otherwise be spent exercising. However, sports-specific media consumption, particularly through social media platforms, had a notably different and positive effect: it was associated with increased sports participation (Tian et al., 2023).

The meta-analysis found that young people who regularly consumed sports-related content online showed higher rates of actual physical sports participation. This suggests that media can serve as a motivational gateway inspiring young people to try new sports or return to activities they had previously abandoned. The relationship is not simply one of displacement, where media time replaces sports time, but rather one of inspiration and promotion, where engaging sports content actively encourages physical engagement (Tian et al., 2023).

The role of sports celebrities and influencers on digital platforms further amplifies this effect. When prominent athletes share their training routines, daily lives, and competitive performances on platforms like Instagram or TikTok, they create aspirational figures that many young people look up to and seek to emulate (García-Fernández et al., 2023). This form of connection sometimes described as a parasocial relationship, meaning the sense of closeness young audiences feel with media personalities they follow online acts as a powerful motivator for sports engagement (Abeza et al., 2022).

Research on e-sports further illustrates the complexity of media-sports relationships (Wang & Cheng, 2023). Wang and Cheng found that young people who played e-sports games showed increased desire to participate in physical sports, mediated through social presence perception and virtual sports experience. This finding challenges the assumption that digital gaming necessarily competes with physical sports, suggesting instead that virtual sports environments can cultivate an interest in real-world physical activity (Wang & Cheng, 2023). The researchers found that the immersive experience of virtual sports created a bridge to physical engagement rather than a barrier to it.

Figure 1: Media Platforms and Their Influence on Youth Sports Culture



Source: Developed by the author based on findings from (Tian et al., 2023), (García-Fernández et al., 2023), and (Abeza et al., 2022).

As illustrated in Figure 1, a range of digital media platforms converge around the promotion of youth sports culture, each contributing through distinct pathways. Social media platforms such as Instagram and TikTok serve as primary channels for motivational content, while online video platforms like YouTube support long-form engagement with sports narratives. E-sports and gaming platforms act as gateways to physical sports interest, particularly among young male audiences. Television and broadcasting retain a role especially for live major events, while athlete personal branding and fan communities online reinforce identity and belonging (Abeza et al., 2022; García-Fernández et al., 2023; Tian et al., 2023)

3.2 Digital Platforms and Sports Content Consumption Among Youth

The way young people consume sports content has changed dramatically in the digital age. Traditional television broadcasting, once the dominant medium for sports consumption, has been supplemented and in many cases replaced by on-demand streaming, short-form video content, and social media platforms (García-Fernández et al., 2023). Young people increasingly prefer content that is accessible on mobile devices, personalized to their interests, and presented in engaging, interactive formats that allow them to respond, share, and interact.

Research analyzing the social media strategies of top football clubs confirms that platforms like Facebook, Instagram, Twitter, and YouTube generate billions of interactions annually (García-Fernández et al., 2023). An analysis of nearly 20,000 social media posts across elite football clubs in Europe, South America, and North America found that fan engagement was highest when content was emotionally resonant, visually compelling, and timely. This suggests that sports organizations must adapt their communication strategies to meet the expectations and habits of young digital audiences (García-Fernández et al., 2023).

Among Generation Z those born approximately between 1997 and 2012 social media is the primary channel for sports content consumption. Research indicates that the vast majority of this generation use social media to access sports content, including game highlights, live events, athlete interviews, and posts from athletes directly (Richard et al., 2022). This generation is not simply a passive

audience; they actively create, share, and remix sports content, making them co-participants in the sports media ecosystem rather than mere spectators.

Short-form video platforms like TikTok and YouTube Shorts have emerged as particularly influential tools for reaching young sports audiences. The short-form video format aligns well with the attention patterns and preferences of young people, enabling sports organizations to distribute highlights, behind-the-scenes content, and athlete personalities in accessible and entertaining ways (García-Fernández et al., 2023). Sports leagues that have embraced these platforms have seen dramatic growth in young viewership, demonstrating the massive reach that sports content can achieve when distributed effectively on social media (Wilska et al., 2023).

The consumption of e-sports content represents another rapidly growing dimension of youth sports media engagement. The e-sports industry has attracted enormous numbers of young viewers and participants globally, with the overwhelming majority of e-sports fans being under the age of 35 (Richard et al., 2022). Research confirms that e-sports content consumption not only entertains young people but can also serve as an entry point into broader sports culture, as virtual sports experiences cultivate interest in physical counterparts (Wang & Cheng, 2023).

3.3 Media, Identity Formation, and Community Building in Sports Culture

One of the most significant ways that media interacts with society to promote sports culture is through its role in identity formation and community building. For young people, sports fandom and participation are not just leisure activities they are closely tied to how they understand themselves and their sense of belonging within social groups (Valkenburg et al., 2024).

Social identity theory, as applied to sports and social media, holds that young people use sports as a vehicle for expressing group membership and reinforcing their sense of belonging to a community (Abeza et al., 2022). Platforms like Twitter and Reddit host vast communities of sports fans who bond over shared loyalties, discuss team performances, and collectively celebrate or grieve sporting outcomes. Research in the field of sport communication found that young people who frequently used social media for sports-related discussions

were more likely to develop a strong group identity and higher collective self-esteem (Abeza et al., 2022).

A systematic review of social media use and adolescent identity development found that active participation in social media rather than simply the amount of time spent was associated with greater identity exploration (Valkenburg et al., 2024). Young people use social media to experiment with different aspects of their personal identity, seek out role models, and receive peer feedback on self-presentation. In the sports context, this translates into young people publicly expressing their alignment with particular sports, teams, or athletic values as expressions of who they are and who they want to become (Dunn et al., 2022).

Athlete role models play a particularly important role in this dynamic. When athletes use their social media platforms to share not only athletic achievements but also personal values, community engagement, and everyday life experiences, they become powerful cultural figures whose influence extends well beyond the sports arena (Geurin, 2023). Research on social media education within national governing bodies of sport found that sports organizations increasingly recognize the importance of athletes' online personas as a vehicle for promoting sports culture among youth (Geurin, 2023).

The relationship between media and sports culture is also mediated by societal factors including gender, ethnicity, and socioeconomic background. Research on young female athletes found that social media plays a specific role in shaping their sports experiences and professional online identities (Dunn et al., 2022). Young women increasingly use Instagram and other platforms to build public identities around their sport, but coaches and parents highlighted the need for supportive policies that guide them in developing positive and empowering digital presences (Dunn et al., 2022).

Youth consumer identity formation through sports media also has important commercial dimensions. Young people's engagement with sports brands, merchandise, and lifestyle products is significantly influenced by their social media activity (Wilska et al., 2023). Research on the role of social media in creating young people's consumer identities found that interactions with sports

brands, athlete endorsements, and influencer marketing campaigns shape purchasing behavior and deepen young people's investment in sports culture as a lifestyle choice (Wilska et al., 2023).

4. Results and Discussion

4.1 Media Platforms and Youth Sports Engagement

The evidence gathered in this article points to a clear finding: digital media platforms particularly social media are the primary drivers of sports culture promotion among young generations today. While traditional media such as television continues to play a role, the shift toward mobile-first, interactive, and participatory digital media has fundamentally changed how young people encounter and engage with sports (Tian et al., 2023; García-Fernández et al., 2023).

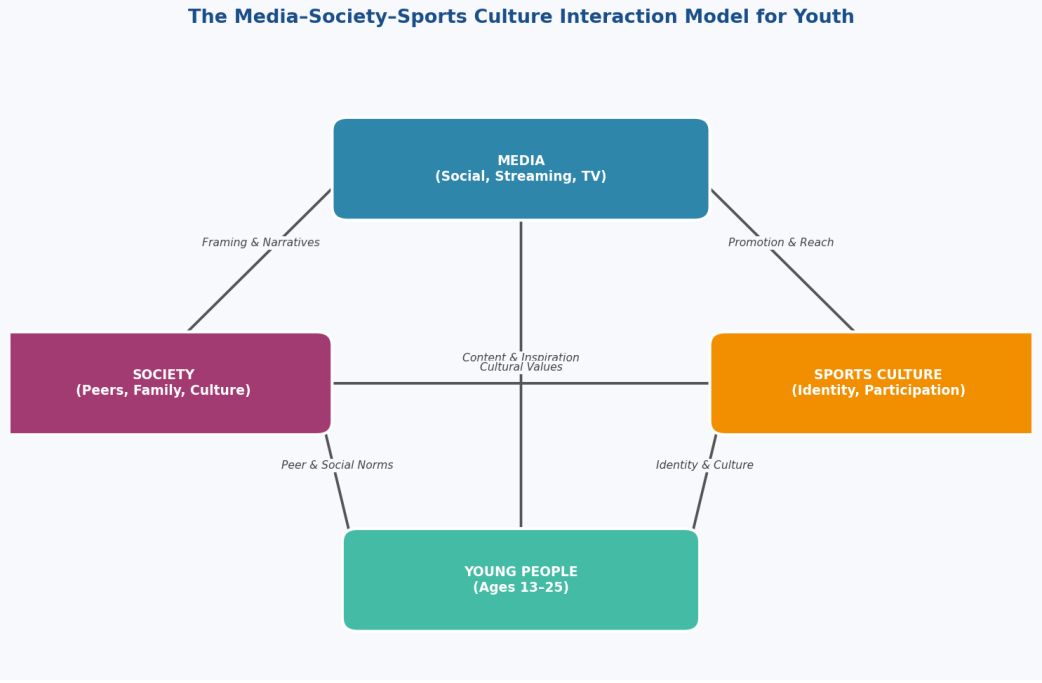
This shift has important implications for sports organizations, media companies, and public health advocates, all of whom must understand young people's media habits to effectively reach and engage them. The finding that sports-specific social media use is positively associated with sports participation (Tian et al., 2023) carries significant practical implications. It suggests that targeted media campaigns and athlete influencer programs focused on motivating young people to participate in sports can serve as effective public health and social interventions. Importantly, the evidence does not support a simplistic narrative that screen time crowds out physical activity; rather, the content and context of media use matter more than the quantity of time spent online (Tian et al., 2023).

4.2 The Media–Society–Sports Culture Connection: A Framework

Understanding how media, sports, and society interact requires a conceptual framework that captures the multiple directions of influence at play. Based on the synthesized evidence, a multi-dimensional model emerges in which media, society, and sports culture form a mutually reinforcing system. Media does not simply promote sports from the outside; rather, it is deeply embedded in the social

experiences, identities, and communities through which young people relate to sports (Abeza et al., 2022; Valkenburg et al., 2024).

Figure 2: The Media–Society–Sports Culture Interaction Model for Youth



Source: Developed by the author based on the theoretical frameworks discussed in (Abeza et al., 2022) and (Valkenburg et al., 2024).

In this model, as shown in Figure 2, media serves as both a channel and an active agent in sports culture promotion. Social media platforms distribute sports content and build awareness of sports activities, teams, and athletes among young people. At the same time, social media enables young people to participate actively in sports culture sharing opinions, building communities, expressing identity, and creating content. Society provides the broader context within which this interaction takes place, shaped by factors including peer norms, family influence, educational environments, and cultural values about sports and physical activity. Sports culture, in turn, feeds back into both media content creation and broader societal attitudes, forming a continuous and dynamic cycle (Abeza et al., 2022; Valkenburg et al., 2024).

This framework helps explain several important patterns identified in the evidence. The finding that social media use for sports is associated with stronger group identity and collective self-esteem (Abeza et al., 2022) makes sense within a model that sees media as a site of active social practice, not just content distribution. Young people are not passive recipients of sports media; they use it actively to build and maintain the social connections that give sports meaning in their lives (Dunn et al., 2022; Valkenburg et al., 2024).

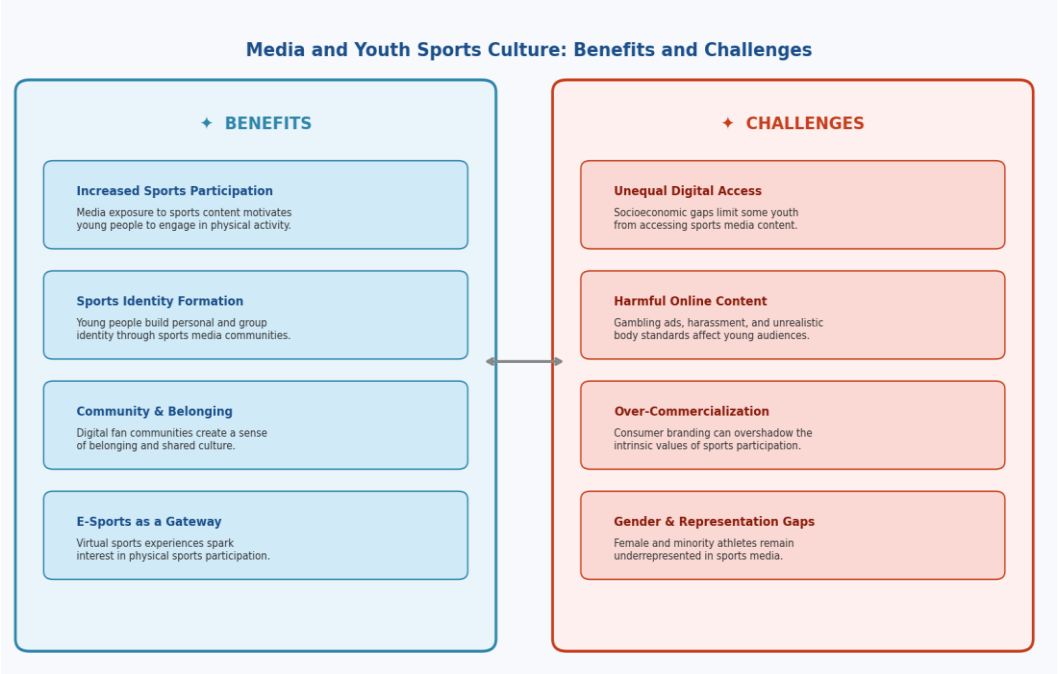
4.3 Challenges and Concerns

While the overall picture is largely positive regarding media's role in promoting sports culture among youth, the research also highlights several important challenges. First, there is the issue of unequal access. Young people from lower socioeconomic backgrounds may have less access to the devices, data plans, and platforms that enable sports media consumption, potentially creating gaps in sports engagement between different social groups (Tian et al., 2023).

Second, the quality and safety of online sports content environments are highly variable. The growth of sports betting advertising on social media has raised serious concerns about the exposure of young audiences to gambling-related content (García-Fernández et al., 2023). Similarly, online environments can expose young people to harmful stereotypes, harassment, and unrealistic body and performance standards, particularly for young women athletes (Dunn et al., 2022).

Third, the commercialization of sports culture through media raises important questions. When young people's engagement with sports is primarily expressed through purchasing branded merchandise, following commercially sponsored athletes, and interacting with advertising-driven content, there is a risk that the intrinsic values of sports such as teamwork, effort, fair play, and physical wellbeing are overshadowed by consumer identity and lifestyle branding (Wilska et al., 2023).

Figure 3: Benefits and Challenges of Media for Youth Sports Culture



Source: Developed by the author based on findings from (Tian et al., 2023), (Dunn et al., 2022), and (Wilska et al., 2023).

As illustrated in Figure 3, the influence of media on youth sports culture presents a dual nature. On the benefits side, media promotes sports participation, strengthens sports identity, fosters community belonging, and opens gateways through e-sports (Abeza et al., 2022; Richard et al., 2022; Tian et al., 2023; Wang & Cheng, 2023). On the challenges side, concerns about unequal digital access, harmful online content, over-commercialization, and gaps in representation require ongoing attention from researchers, practitioners, and policymakers (Dunn et al., 2022; Tian et al., 2023; Wilska et al., 2023).

4.4 E-Sports as an Emerging Dimension of Sports Culture

One of the most rapidly developing areas within the media-sports-society intersection is the rise of e-sports. The evidence clearly shows that e-sports represent not just a new form of entertainment but a significant cultural force with

implications for how young people relate to sports more broadly (Richard et al., 2022; Wang & Cheng, 2023). The finding that virtual sports experience can increase the desire for physical sports participation (Wang & Cheng, 2023) suggests that e-sports are not simply competitors to traditional sports but potential entry points for young people who might not otherwise engage with sports culture.

The inclusion of e-sports in major international events such as the Hangzhou Asian Games in 2022 reflects growing institutional recognition of e-sports as a legitimate sporting form (Richard et al., 2022). Moreover, research highlights that e-sports engagement promotes the development of 21st-century skills including teamwork, strategic thinking, and communication among young participants (Richard et al., 2022). Sports organizations and media companies that understand and work constructively with the e-sports trend will be better positioned to promote a broad and inclusive sports culture for young generations.

4.5 Implications for Communication and Sport Professionals

The findings carry clear practical implications for communication professionals and sports organizations. Sports organizations need to develop platform-specific social media strategies that speak to the preferences and values of young audiences (García-Fernández et al., 2023). Content must be visually compelling, emotionally engaging, authentic, and respectful of young people's diversity to build and sustain meaningful connection (Geurin, 2023). Research confirms that athlete training in social media communication is an increasingly important element of sports governance at all levels (Geurin, 2023).

For public health and youth development professionals, the evidence supports investment in sports media campaigns that emphasize accessibility, diversity, and the personal and social benefits of sports participation. Framing sports not only as competitive performance but as a source of identity, community, and wellbeing resonates with the ways young people themselves engage with sports in the digital age (Valkenburg et al., 2024).

Media literacy education is another important practical implication. Young people benefit from being equipped with critical tools to navigate sports media environments thoughtfully to enjoy the community and inspiration that these

spaces offer while also being aware of commercial interests, potential harms, and the sometimes-distorted representations of athletic life that appear online (Dunn et al., 2022).

5. CONCLUSION

This article has examined the interaction between media and society in promoting sports culture among young generations, drawing on evidence from recent academic research across communication studies, sports science, psychology, and media studies. The central finding is that digital and social media have become the primary vehicles through which sports culture is transmitted to, and actively constructed by, young people in contemporary society.

Social media platforms particularly Instagram, YouTube, and TikTok dominate sports content consumption among youth. Sports-specific media use is positively associated with sports participation, and the nature and quality of media engagement matters far more than the raw quantity of time spent online (Tian et al., 2023). Media also plays a significant role in identity formation and community building within sports culture, enabling young people to express group membership, connect with role models, and develop their sense of self through their relationship with sports (Abeza et al., 2022; Valkenburg et al., 2024).

E-sports represent a growing and important dimension of the media-sports-society landscape, with evidence demonstrating that virtual sports engagement can serve as a bridge to physical sports participation and support the development of key life skills among young people (Richard et al., 2022; Wang & Cheng, 2023). At the same time, important challenges remain: unequal access to digital media, harmful content including gambling advertising, online harassment particularly for young women, and the risk of over-commercialization of youth sports identity all require ongoing attention (Dunn et al., 2022; Tian et al., 2023; Wilska et al., 2023).

Several important directions for future research emerge from this analysis. More longitudinal research is needed to track how media consumption patterns shape sports participation and identity development across adolescence. Further

investigation into the specific features of social media content that most effectively motivate sports engagement among youth would be valuable. Comparative research across different cultural and national contexts would help clarify how societal factors modulate the relationship between media and sports culture promotion. Finally, the intersection of e-sports and physical sports culture requires deeper investigation as the global e-sports industry continues its rapid growth.

In sum, the media-society-sports culture relationship is dynamic, multidirectional, and deeply embedded in the social lives of young generations. Communication professionals, sports organizations, educators, and policymakers who understand and constructively engage with this complex relationship will be best positioned to promote inclusive, healthy, and culturally meaningful sports experiences for young people in the years ahead.
